YOU'VE BEEN FLASHED!

Your vehicle is equipped with computers that process information and control the engine, transmission and a variety of other functions. These powerful computers are designed to be flash reprogrammed with updated software, known as calibration files. These updated calibration files are frequently released by your vehicle manufacturer to maintain optimum efficiency, driving comfort and accurate diagnostics.

We will normally check for these calibration file updates:

- As part of our "21st Century Tune Up"
- If you have a trouble light illuminated
- If you have a problem/driveability complaint
- As part of a complete vehicle inspection

These important updates are similar to those for your home or office PC. These revised calibration files can save you money. Here's how:

- Optimum engine performance and timing = Improved fuel economy
- Optimum transmission shifting = Improved driveability and fuel economy
- Improved diagnostics = Helping a Technician inspect and troubleshoot problems quickly saves on labor costs and leads to accurate repair the first time
- Plus many other improvements and fixes

All vehicle manufacturers now use flash technology, with some beginning as far back as the 1993 model year. We have invested in the latest flash programming equipment and OEM subscriptions to access the calibration data for your car or truck. If you have any questions, please ask one of our advisors.

PROBLEM?

- CHECK ENGINE LIGHT ON?
- DRIVEABILITY COMPLAINT?
- SCAN DATA CORRECT?
- LATEST SOFTWARE CALIBRATION?
